* Suitable for 2 users

All machines are designed for use with either 2-inch or 50mm OUTSIDE DIAMETER pipe - NOT plumbing pipe

CVC Direct hose & accessory kits are well specified and include a hose hanger, tool caddy bag and telescopic tubes as standard.

CVC Direct installation kits contain a generous allowance of pipe & fittings so that running out during installation is less likely.

Hoses available in 7.5m, 9m & 10m lengths A remote control switched hose is an optional extra. **NB. A short hose is more efficient than a long one**

NB. The important factor in determining which model to use is the suggested length for the single longest run of pipework. This is the distance between the vacuum unit and the vacuum socket furthest from the unit. It is not important how many runs of pipe are used so long as none of them exceed the maximum recommended distance. The area covered by any particular unit is given as a guide only - a long narrow building requires a different vacuum unit to a compact square building of the same area. The suggested length for the longest run of pipework is installed length & takes into account the fact that a long flexible hose will be used at the end of the run. Each model will work with a much longer run of pipe. However, these vacuum units are conservatively rated & will give an impressive performance if used within the suggested length.

On most vacuum units, it is recommended that the carbon brushes on the motors & the textile filter be changed after approx 8-10 years of normal use.

The performance of the M1511 & M2001 is similar. However, the M2001 has a bigger motor running at a slower speed and will have a longer service life than other units with the same performance

§ Similarly, the performance of the M2411 & M2501 is similar. However, the M2501 has a bigger motor running at a slower speed and will have a longer service life than the M2411
